(54) MAGNETIC RESONANCE IMAGING APPARATUS

(57)Abstract:

PURPOSE: To adjust the gain of a preamplifier automatically, by correcting the output of the preamplifier by an amplifying means in response to the output of an electric signal identifying means corresponding to the characteristics of respective probe heads.

CONSTITUTION: A first probe head 1 is connected to a preamplifier 3. Then, an identifying signal is inputted to a detector circuit 5, and one of relay coils KA is operated. Therefore, a relay contact Ka is closed, and one feedback resistor RA is made to act on an amplifier 4. The amplifier 4 is corrected by the resistor RA, and an output signal, which matches the characteristics of the first probe head 1, is outputted to circuits in a succeeding stage through an output terminal 7. When the operation is switched to a second probe head 2, a feedback resistor RB is made to act on the amplifier 4. The output corresponding to the characteristics of the second probe head 2 is outputted from the terminal 7.
